Research concerning cognitive biases has demonstrated a high convergence of subjective beliefs, experimentally measured trait-like personality differences, and neurophysiological differences in human subjects with different psychopathologies. This convergence has generated substantial interest in the question of whether, and how, biased cognitions may play an etiological role in psychopathology. A number of studies have examined cognitive biases in borderline personality disorder (BPD). In some cases, the findings reveal the existence of cognitive biases in BPD which are consistent with distinct theoretical assumptions, but in other cases the findings have been interpreted in a manner which is difficult to reconcile with distinct theoretical assumptions. However, some interpretative inconsistencies may be resolvable on the basis of a broader theoretical context that includes a consideration of both individual and group-level differences. In this way, the present review concludes that the evidence obtained to date does not at present clearly support the presence of clear cognitive biases in BPD. However, there are a number of features which are observable in the extant data that must be taken into account when attempting to make generalizations about the possible neurophysiological underpinnings of such cognitive biases.Q: Create a new directory in correct path I am creating a new directory on the fly like this os.system("mkdir -p /tmp/123") The problem I am having is that the /tmp/ is actually in a different location from where this is written.
